CHAPTER 2

RESILIENCE

2.1. Introduction

This chapter aims to dissect the multidisciplinary usage of ‘resilience’ and frame said usage in the tourism organizational construct, establishing a categorization of resilience, and exploring business resilience frameworks as well as a means of measuring resilience.

Through dissection of many resilience definitions and applications, posed and developed in various disciplines, a theory of resilience categorization can be seen to form and is briefly mentioned in 2021 by researchers Weking, Pérez, and Schaffer. This categorization method is a key theory for this research and can be useful when applied to tourism business resilience understanding; however, to understand this theory’s derivation and its applicability in this context, resilience as a concept must first be fully explored.

Before exploring tourism business literature, business literature must be broadly examined. Researchers Ducheck (2019) and Hepfner and Lawrence (2022) are key theorists in business resilience literature. Both pose similar definitions of business resilience, though their research diverges when examining their different frameworks of business resilience. The theory of categorization coupled with these business resilience frameworks creates a lens from which tourism business resilience can be examined. However, to be able to utilize the frameworks of resilience, an understanding of resilience measurement is necessary.

Researchers Saad et al. (2021) aid in this understanding. After analyzing 118 articles regarding business resilience measurement, they were able to determine key factors of business

resilience. After understanding resilience definitions, frameworks, and measurement, this can then be directly applied to tourism business. Researchers such as Butler (2017) and Hall, Prayag, and Amore (2018) can be shown to examine tourism resilience using research from business resilience literature.

This chapter concludes by discussing the culmination of Saad’s et al. (2021) analysis of factors of business resilience along with the frameworks posed by Ducheck (2019) and Hepfner and Lawrence (2022) and the categorization method mentioned by Weking, Pérez, and Schaffer (2021), painting an illuminating picture of tourism business resilience.

2.2. Understanding Resilience

Resilience is used in various contexts to explain the phenomena of responding to and enduring through adversity, though there is debate on the exact definition of resilience and this definition usually appears contextual. The term resilience is derived from the Latin word *resilio*, which means to *jump back* (Klein, Nicholls, & Thomalla, 2003). This has been adapted in the business world to refer to the capability of systems or groups to recover from an interruption or shock. Though, Resilience research first gained traction in the field of psychology. The American Psychological Association (APA) defines resilience as “The process and outcome of successfully adapting to difficult or challenging life experiences, especially through mental, emotional, and behavioral flexibility and adjustment to external and internal demands”. Atkinson et al. (2009), focusing on psychology and the individual, describes resilience as the ability to recover from deprivation, trauma, stress or threats; by this definition, resilience cannot take place without the cue of an extreme to activate the resilient response. This necessity for the cue of an extreme or an adversity remains an important theme throughout resilience discussions in various disciplines.

Building on research at the individual level, business resilience literature acknowledges both individual employee resilience as well as overall organizational resilience. Sutcliffe and Vogus 2003, Gherhes et al. 2018, and Santoro, Messeni-Petruzzelli, and Del Giudice 2020, all state that within firms, resilience is influenced by factors on both the individual employee level as well as the organisational level. Employee resilience contributes to the effectiveness of organizational resilience, however, organizational resilience focuses on the firm's ability to transform and capitalize on disruptive surprises and potential threats (Santoro, Messeni-Petruzzelli, and Del Giudice, 2020). Thus, understanding the psychological needs of an individual in relation to resilience is necessary when considering organizational resilience.

Of course, resilience is discussed in other academic disciplines as well. For example, Folke, 2006, defines engineering resilience as the ability to bounce back to the predesigned stage or function after facing stress. Changing from a notion of 'bouncing-back' to a recognition of a need to change due to adversity, in the field of ecology, Berkes et al., 2008, defines ecological resilience as the desirable change in the stage of an ecological system following the presence of a stressor. Following the trend of exploring 'change' when considering resilience, Tyrell and Johnson, 2008, define social-ecological resilience as a focus on planning and resource management which seeks adaptive capabilities, innovation capabilities, and learning. In contrast, when defining socio-ecological resilience, Walker et al., 2004, argues the previously mentioned 'bouncing-back' notion, stating that resilience is a socioecological systems ability to reorganize itself after a triggering event and absorb disturbances so that the system basically retains the same feedbacks, structures, identity, and functions.

Definitions of resilience change depending on the scope from which one examines it, however, there are common themes throughout the definitions in every discipline. These themes

include a need for adversity or a triggering event as well as a notion of either 'bouncing-back', 'changing', or a combination of both. Despite not having an agreed upon definition of resilience throughout disciplines, resilience continues to be a popular area of research in academia.

Though a popular term at the moment, 'resilience' is more than just a buzzword. Derickson (2016, p. 161) argues that "resilience is more than a buzzword; it is a normative good to which civil society groups and regional governments aspire". Cai (2020) agrees that while resilience has gained popularity, it is more than a buzzword and when embraced can aid in inclusive collaboration and transformative innovation during times of crises. As a result of its increased usage, the definition of resilience has been changed and transformed through its application in various academic disciplines.

Anderson (2015, p. 60) argues that its modern use is as a "promise of security" or a "desperate hope of survival in a world of rolling crises". It is easy to see why this term has increased in popularity, as the world sees many challenges stemming from the effects of global warming to the recent global pandemic.

2.2.1. Understanding Resilience in Tourism

Tourism is an industry that is highly susceptible to unanticipated, external shocks like economic recessions, natural disasters, management failures, unpredictable catastrophic change, terrorist attacks, and military interventions (Dahles & Susilowati, 2015). Climate change, recessions, possible future pandemics, and a myriad of other unforeseen events, pose a threat to the global tourism industry in the near and distant future. Hoogendoorn and Fitchett (2016) assert that climate change has the potential to reduce the sustainability and long-term viability of global tourism. Thus, the 'resilience' concept has become an increasingly important focus in tourism

research. The popularity of resilience as a research topic in this industry is understandable as, according to Butler (2017), ‘resilience’ appears to fit what is needed in tourism as there is great importance put on the tourism industry's ability to cope with development, change, and disasters or conflicts that could reduce tourism drastically and suddenly.

Although it has gained popularity as of late, research on ‘resilience’ came considerably late to tourism. The term didn’t appear in tourism research until the 2000s, spurred by the increase of volatility in the growing industry (Hall, Prayag, & Amore, 2018). As such, there are limited studies available which explicitly examine tourism resilience, showing a gap in the literature in relation to other social science ‘resilience’ exploration. Doğan and Akoğlu (2019, p. 127) state that “upon reviewing the resilience studies in the area of tourism, it is noteworthy that the concept and characteristics of resilience are largely unclear and that the subject is predominantly at the level of destinations, using conceptual, second data or a qualitative approach to determine the resilience of post-crisis destinations”. Thus, tourism business resilience appears to be an area for further research. Though, in recent years, propelled by the Covid-19 disruption to tourism, tourism business resilience research has increased.

As in other areas of resilience research, among the research conducted in the area of tourism and resilience, Cheer and Lew (2021, p. 25) note that “one of the commonalities in writings on resilience in tourism is that they are related to an actual or potential response to change”. A disturbance or adversity is thus assumed when discussing resilience in tourism. This echoes the discussion above, in which adversity is necessary for resilience to occur.

Noted by most researchers is the complex, dynamic, and interactive systems involved in tourism which can impact resilience in the industry. Although researchers acknowledge the

“dynamic nature of complex socio-ecological adaptive systems of which tourism is a part”, much of the research output focuses on utilizing equilibrium-related definitions stemming from research in disaster management, engineering, and economics instead of socio-ecological definitions of resilience (Hall, Prayag, & Amore, 2018). Some argue that this type of resilience can be difficult to translate to tourism studies, as they focus on creating systems that are stable and predictable and will return to the pre-existing state of equilibrium after a disturbance.

Ecological definitions of resilience are typically viewed as hierarchical and dynamically linked, meaning that local interactions could influence the system as a whole (Hall, Prayag & Amore, 2018). However, it is argued in academic subjects such as holism, emergentism, and organicism, that the whole can be understood without taking much, if any, consideration to the various parts that make up the whole or their relationships. This stands in contrast to approaches such as engineering resilience, in which the whole is always considered as the sum of the properties of its parts (Cheer & Lew, 2021; Keller & Golley, 2000).

Depending on which perspective one takes when examining tourism, whether examining tourism as a whole or as a sum of the various parts that contribute to the whole system, can lead to vastly different results when determining how tourism responds to adversity. Specifically, this determination will guide the importance of tourism businesses in the resilience equation. If one concludes that tourism must be examined as a whole, rather than the sum of its parts, then tourism businesses are less important to the understanding of tourism resilience. However, if it is determined that tourism should be examined as a sum of its parts, then tourism business can affect the resilience of tourism and are far more important when examining the resilience of tourism.

In terms of a tourism system as a whole, Cheer and Lew (2021) argue that adaptation and self-organization as the system moves between states is what is significant and that an individual tourism business is neither a negative or a positive in relation to the entire tourism system. Following this argument, business resilience and tourism resilience do not have an intrinsic relationship. So, in this case, it is not necessary for all businesses to survive in order for there to be tourism resilience; it would be important to identify the most significant businesses, and then focus on them and their resiliency (Cheer & Lew, 2021; Biggs et al., 2015). However, there is no clear model or framework which examines which areas or particular businesses must survive for resilience of the entire system to occur.

In contrast, studies that look at tourism resilience from an engineering perspective tend to focus on individual businesses survival with the assumption that mass survival translates to overall resilience (Cheer & Lew, 2021; Orchiston et al., 2016). In disaster management studies, Orchiston et al. (2016) notes that researchers emphasize business survival with the assumption that business resilience thereby leads to overall destination resilience. Cheer and Lew (2021) note that such belief systems that assume business survival translates to destination survival inform resilience policy making. This relates back to the interconnectivity of tourism, as governance and policies can have a direct impact on tourism resilience (Hall, Prayag, & Amore, 2018).

Socio-ecological resilience approaches are comparable to the previously mentioned engineering resilience approach. However, in this case, the businesses that are deemed to contribute the most to overall system maintenance are the businesses that must survive to ensure overall system resilience. During times of change, new businesses with resilient adaptations can be established replacing the failed businesses that were deemed inessential to overall system

integrity (Cheer & Lew, 2021; Hall, Prayag & Amore, 2018). Cheer and Lew (2021, p. 27) thus propose “a more critically-formulated definition of resilience” in relation to tourism, being “that resilience is the capacity of a system to sustain a certain set of services, in face of disturbance, uncertainty, and change, for a certain set of humans, meaning that there is a need to analyze not just how systems are managed, but also the priorities of the system and who benefits from it”. Notably, this definition connects the idea of policy impacting tourism and pushes a need to examine such policies for purpose.

2.2.2. Conclusion

Adversity is a common necessity in resilience literature and tourism resilience literature. This, along with an idea of preparation for adversity appears in both. In tourism, there has been some debate as to the level of importance that tourism business resilience has on tourism resilience as a whole. It is important to note that both engineering and socio-ecological resilience approaches would put business resilience at the forefront of tourism resilience. As such, business resilience can be seen as integral to overall tourism resilience regardless of the definition of resilience being utilized in the research and is therefore an important area of study.

2.3. Resilience in Business Literature

When facing adversity, Murison (2021, p. 1) defines organizational resilience when stating that “a resilient organization is not one that is simply able to return to where it left off before the crisis. A truly resilient organization is one that has transformed, having built the attitudes, beliefs, agility and structures into its DNA that enable it to not just recover to where it was, but leap-frog forward quickly”. Here, Murison is arguing that organizational resilience focuses on strategies to overcome crises and remain competitive during adverse conditions.

In their encompassing examination of organizational resilience, Hepfer and Lawrence (2022) argue that resilience includes both the ability of businesses to respond to adversity and also to anticipate and learn from adversity. They define organizational resilience as “the ability of an organization to anticipate, respond to, recover from, and learn from adversity” (Hepfer & Lawrence, 2022, p.8). Duchek (2019) echoes this argument, stating that resilient organizations are ones that are able to anticipate, cope with, or adapt to adverse events.

Resilient businesses are able to adjust their strategies under challenging conditions and find opportunities through analyzing threats and changes (Boyne & Meier, 2009). Santoro, Messeni-Petruzzelli, and Del Giudice (2020) argue that organizational resilience can be seen from two differing perspectives: one side argues that organizational resilience stems from the ability to rebound from adverse situations, while the other side states that organizational resilience is shown through the creation of novel opportunities from the development of new capabilities, or innovations.

Of course, adapting and changing can entail certain risks. The inherent risks that come with change can often stifle an organization's willingness to adjust strategies. Although, Nauck et al. (2021) argue that businesses who are unwilling to take sufficient risks will not respond or innovate to meet changing circumstances and will thus suffer under adverse conditions. On the other hand, businesses that focus too heavily on expansion, financials, and growth might take on too much risk that then kills long-term growth. Nauck et al. (2021, p. 3) concludes that organizational resilience requires “balanced focus on six dimensions: financials, operations, technology, organization, reputation, and business model”. However, Suarez and Montes (2020) argue that organizational routines, heuristics, and improvisation are the keys to organizational resilience.

The lack of consistency when explaining methods to achieving organizational resilience is related to the varying definitions of organizational resilience. “Based on the different definitions, scholars usually develop their own conceptualization which is oriented to the specific goals of the investigation” (Duchek, 2019, p. 220). Notably, organizational resilience will often be defined based on the goals of that business.

Businesses or organizations might all endure the same adversity, yet some businesses survive, some thrive, and some die. The ability of businesses to respond to adversity can greatly vary. Organizational resilience describes this ability for businesses or organizations to respond to adversity. This need for adversity or a triggering event to occur is intertwined with resilience as described earlier. Thus, an organization which has never faced adversity cannot be considered to be resilient (Darkow, 2019). On the same note, resilience does not equate to an inability to fail; under certain circumstances, even resilient businesses can fail. The resilience of an organization can thus be inferred based on its performance under adversity. The more resilient an organization, the more adversity said organization can weather (Hepfer & Lawrence, 2022).

However, different forms of adversity can affect businesses in different ways or, one business may be affected while another is not affected at all or affected to a different degree. For example, the Covid-19 global pandemic posed a massive threat to international airlines while the organization ‘Zoom’ was able to capitalize on this adversity, converting business meetings to online meetings, thus finding an opportunity within this adversity (Hepfer & Lawrence, 2022). So, adversity can be seen to affect different businesses to different degrees.

Hepfer and Lawrence discuss the different ways organizations can be affected by adversity in their organizational resilience framework. These key tenets, which are discussed in depth later in the Organizational Resilience Framework section, dissect organizational resilience

into three types of resilience: functional resilience, operational resilience, and strategic resilience. Functional resilience refers to adversities that affect only one unit or function of an organization. Operational resilience refers to an adversity that affects the whole of an organization, often stopping the organization from operating. Strategic resilience refers to an adversity that affects the long-term goals and strategies of an organization (Hepfer & Lawrence, 2022). In their organizational resilience framework, Hepfer and Lawrence break down these types of organizational resilience further.

Notably, Hepfer and Lawrence (2022) examine the importance of communication and relationships between members on the organization's team in regard to the different types of organizational resilience. There is often mention of the importance of employee resilience and participation when examining organizational resilience. Saad et al. (2021) reiterates the importance of employee participation and organizational leadership, noting employees and management/ decision-makers as integral to organizational resilience. Linnenlueke (2017) argues that organizational responses to adversity, organizational reliability, employee strengths, and the adaptability of business models are all important aspects of business resilience. Decision-makers, management, and employees all play a part in implementing innovations and adaptation for businesses.

2.3.1. Employee/ Individual Resilience

On the individual level, employee resilience is often discussed when considering overall organizational resilience. "When employees are resilient, they think more clearly, solve problems more effectively, cope with stress more successfully, and report better relationships at work" (Barsky and Waters, 2021). Employee resilience is defined as the employee's capability to

continually adapt and excel at work, despite facing challenging circumstances, while utilizing resources and being supported by the organization (Kuntz et al., 2016).

Tonkin et al. (2018), differentiates employee resilience from personal resilience in three ways: the first being that employee resilience is "operationalized in terms of workplace behaviors, rather than a set of dispositions or beliefs about one's ability to cope with adversity", the second is dependent upon how the work-related resources impact resilient workplace behaviors beyond the effect of positive coping while at work, and lastly, these resilient employee behaviors can be developed despite a lack of significant adversity and in any work environment. This argument is in contrast with other resilience definitions which require adversity to be present in order to have resilience. Tonkin et al. (2018) describes employee resilience as buildable despite a lack of adversity or in preparation to possible adversities.

However, this explanation of employee resilience negates the impact of an employee's personal life outside of the work environment. Barsky and Waters (2021), argues that daily stresses, such as family needs and commute times, along with larger life crises, such as health matters, can have a severe impact on employee resilience. Combining these two concepts, Linnenluecke, 2017 states "employee resilience reflects not only the ability to recover from adversity but also the capacity to utilize and proactively develop personal and workplace resources". Additionally, researchers Tonkin et al., 2018, were able to find a positive relationship between personal and employee-level resilience, showing that if a person is resilient in his or her personal life, this will translate to workplace resilience as well.

In contrast to Tonkin et al. (2018), in terms of understanding what factors lead to the development of resilience, Seery et al. (2013) draw attention to the importance of adversity. They argue that there is an upside to adversity-- the building of employee resilience. More formally,

those researchers suggest that moderate levels of adversity coupled with adequate levels of organizational support is what enables employee resilience. However, Kuntz, Malinen, and Näswall, 2017, counter this claim by suggesting that significant adversity in the workplace is not essential to developing resilient employees. Rather, they suggest that building employee resilience is key to mitigating adverse effects of crises, and thus should be developed prior to such crises occurring. They suggest that employee resilience should be built during the preparation phase of organizational resilience.

Leaders can play an important role in promoting employee resilience. Murison, 2021, states that leaders need to embrace perspective, requiring leaders to challenge the status quo, purpose, as leaders need to unite their team and build a sense of community, and potential, as leaders need to capitalize on their teams' capabilities. Barsky and Waters, 2021, add to this by stating that leaders can build employee resilience by generating resources and enabling good mental health habits amongst their employees. Expanding on their additions, Barsky and Waters, 2021, explain that resources include information, network connections, and positive energizers, and good mental health habits include taking effective breaks and improving time-management skills. Additionally, lightening the workload by establishing realistic due dates, delegating effectively, and collaborating as a team whilst contributing emotional support all assist with improving employee resilience. From this, it could be concluded that an employee's well-being has a direct impact on his or her resilience levels.

Another question posed in the literature is how to recognize resilience. Barsky and Waters (2021) argue that there are four types of behavior that reveal low levels of resilience in employees. These behaviors are fight, flight, freeze or fawn. Freezing is displayed as apathy, inaction and low motivation. Fawning can develop as excessive people-pleasing, perfectionism,

and presenteeism. Fight is identifiable by argumentative behavior and irritability, and flight is displayed by avoiding interactions at all. Managers and leaders who are able to identify these low-resilience indicators will be better equipped to intervene and help improve productivity and employee morale (Barsky, and Waters, 2021).

In fact, the terms resilience and well-being are often used interchangeably and are consistently associated with one another in psychology literature (Tonkin et al., 2018). With such a link, "focusing on increasing employee wellbeing is likely a fruitful approach to building employee resilience" (Cooper et al., 2013). This individual level resilience, argues Santoro, Messeni-Petruzzelli, and Del Giudice, 2020, is the foundation of organizational resilience. Employee-level resilience and organizational-level resilience combine to influence resilience in organizations as a whole (Cameron, Sutcliffe, and Vogus, 2003). Employee level resilience can assist in innovations and adaptations for organizations when facing adversity.

2.3.3. Conclusion

Resilience in Business literature maintains the need for adversity or a triggering event to occur, though the way in which this adversity impacts or affects different businesses may differ. The literature then diverges into two different discussions of resilience-- one that argues for a return to an original state and one that argues the need for adaptation, despite the risks associated with said adaptation.

Throughout this discussion, there is a focus on various factors of business resilience, both internal and external, such as financials, operations, technology, organization, reputation, and business model. This can be further analyzed on the level of the individual by examining employee resilience which is argued to be another key factor of organizational resilience. This literature relies heavily on research in psychology, showing the multidisciplinary nature of

resilience. Business resilience is equally as transverse, and can be examined throughout various specific industries.

2.4. Resilience in Tourism Businesses

As an industry, tourism is highly susceptible to adversities, as mentioned previously. In 2010, an earthquake in Canterbury New Zealand affected 94% of tourism businesses despite this sector reporting that it had the highest number of organizations planning for unexpected events (Hall, Prayag, & Amore, 2018). Tourism's susceptibility to adversity shows the need for the understanding of tourism business resilience.

When examining tourism business resilience, many researchers focus on tourism-dependent businesses. Ntounis et al. (2021) determined that tourism-dependent businesses include hospitality/ accommodation business such as hotels, hostels, and other accommodation, food and beverage businesses such as restaurants and pubs, retail sales of non-food items such as clothing sales, cultural and recreation, and communication, and arts, entertainment and recreation businesses or attractions such as libraries, performing arts, museums, and sports facilities. There is little information, as noted by Hall, Prayag, and Amore (2018), in regard to which types of tourism organizations, if any, are more resilient in the face of adversity.

Though several studies discuss resilience in the context of tourism businesses, a specific definition of tourism business resilience is rare. Buultjens et al. (2017, p. 84) were one of the few to define tourism industry resilience as “the capacity of the industry to deal effectively with disasters and self-inflicted crises in order to maintain ... stability ... whilst also ensuring the flexibility and diversity necessary for innovation and further development”.

There appears to be a lack of an agreed upon definition of tourism business resilience, and researchers who have examined this subject utilize broad organizational resilience definitions to explore this topic. This shows a gap in the literature in terms of defining and noting differences between organizational resilience and tourism-specific organizational resilience.

2.4.1. Tourism Organizations and Innovation

In the context of tourism, Hall and Williams (2020) note that innovation requires further exploration. Government policies specifically targeting this industry in regard to innovation tend to be more rare than other industries (Hall, & Williams, 2020). As such, ease of access to finance can be a hindrance on innovation in this sector. In turn, large tourism organizations are often able to innovate easier than small to medium sized organizations due to having financial access as well as other resources that smaller organizations may not be able to acquire (Hernández-Esquivel et al., 2022).

However, Hoang, Wilson-Evered, and Lockstone-Binney (2019) argue that leadership is highly influential for tourism organization innovation. They explain that the following leadership styles have been shown to be highly influential for innovation: transformational, transactional, leaders member exchange and authentic leadership. These styles each “enact behaviors to influence others to innovate” (Hoang, Wilson-Evered, & Lockstone-Binney, 2019, p. 648). From this, it can be assumed that employee resilience is also important for tourism business resilience especially in the context of innovation. Another similarity from organizational resilience literature, Hernández-Esquivel et al. (2022) reiterates the previously mentioned need for technological and business model innovations for organizational resilience in a tourism context. This research is limited, however, as Hernández-Esquivel et al. (2022) mentions a need for further research in this area.

2.4.2. Conclusion

Tourism businesses are noted to be highly affected by adversities, noting a specific requirement for resilience. On top of this, if following a resilience ideology that demands adaptation and innovation, tourism businesses often lack the financial resources that would assist in such endeavors. Leadership and individual employees can be seen to be relied heavily upon for innovation efforts. Though there are specific attributes separating the tourism industry from other industries, tourism business resilience literature echoes the ideas presented in organizational resilience literature. Organizational resilience definitions, strategies and frameworks are applied directly to tourism businesses.

2.5. Organizational Resilience Frameworks

Though organizational resilience is an important area of study, most studies retrospectively analyze this topic after a threatening situation has occurred (Linnenluecke & Griffiths, 2011). However, Duchek (2019) developed a framework to examine the underlying mechanisms that foster the development of organizational resilience. This framework comprises a processual approach, which includes three stages (anticipation, coping, and adaptation), and a focus on resilience capabilities, such as proactive capabilities and reactive capabilities.

Typically, theoretical frameworks of organizational resilience can be broken down into three categories. The first being frameworks that treat resilience as an outcome. The second, being frameworks that describe resilience as a process. The third, are the frameworks that focus on resilience capabilities (Duchek, 2019). Depending on the researcher's definition of resilience as well as his or her focus of the study will determine which type of framework will be developed. Thus, resilience frameworks will vary between studies. Duchek (2019, p. 220) explicitly states this discrepancy, arguing that in the literature, there is "little consensus regarding

the conceptualization of organizational resilience". However, Duchek does propose her own framework of organizational resilience, building on previous research in the area.

Duchek developed her framework based on a combination of two approaches. The first, being research which has defined different stages of resilience and that recognizes the dynamic nature of resilience. Resilience, from this perspective, means responding to adverse events before, during, and after said event (Duchek, 2019; Linnenluecke et al., 2012; Williams et al., 2017). Through this assumption, and as mentioned previously, Duchek proposes three successive stages of resilience: anticipation, coping, and adaptation. Her framework is shown in the following figure, figure 3 (Duchek, 2019, p. 224):

Figure 3:

She argues that organizations respond to past issues, current issues, and future issues. The anticipation stage, which is the first dimension of Duchek's organizational resilience framework,

involves detecting critical developments within the firm or in the environment and adapting accordingly. This involves being able to observe internal and external developments and identify critical developments and threats and to prepare for the unexpected. In this stage, observation and identification are crucial.

As Duchek notes, some businesses are able to see unexpected events quicker than others and react faster, while others take the ‘wait and see’ approach. I would argue that being proactive in nature is key in this stage, rather than being reactive.

The second phase mentioned in Duchek’s framework is coping. This phase refers to the ability to cope with or handle unexpected events and adversity. She then breaks down this category into two necessary tasks-- to accept the adversity and to implement solutions (Duchek, 2019). She argues that acceptance is necessary as firms may take refuge in denial when unexpected events occur. Without acceptance, the implementation of solutions cannot take place. In this stage, I would argue that the goals of the implemented solutions to adversity will differentiate amongst various businesses.

The last stage of Duchek’s framework is the adaptation stage. This stage is broken down into two elements, reflection and learning, and change. This stage “refers to adjustments following crises and is directed toward organizational advancement” (Duchek, 2019, p. 230). In this stage, reflection and learning take place during which the business examines the adversity and incorporates the gained insight into the business’s knowledge base. However, Duchek notes that there are several studies which show that organizations have both been able to learn from adversity and also some that fail to learn from the adversity and therefore are open to facing the adversity again (Duchek, 2019; Sagan, 1993). Organizations that do learn from adversity might then go on to change and adapt to better face similar adversity in the future. However, Duchek

notes that not all organizations that have learned from the adversity do go on to implement changes. So, even though businesses might examine the adversity, they may not adapt or change at all.

We can see through the literature that many scholars promote adaptation and innovation when discussing resilience. Li et al. (2021, p. 46) notes that “scholars hold that resilience requires business to have adaptive thinking, which is a mindset that businesses are willing and able to shape their behaviors and practice flexibility in accordance with the changes from the external environment”. Ritter and Pedersen (2020) note that during the resilience process, businesses may retire or suspend rigid capacities that hinder growth in favor of innovations through improvements and creations. Li et al. (2021) argue that resilient businesses not only have short-term coping capacities for recovering from disturbances, but also have long-term adaptive and innovative abilities capable of producing profound changes to the business model post crises or disturbance. Wang et al. (2019) states that innovation is important for businesses to remain resilient in the face of disturbances.

Duchek’s framework for organizational resilience, which divides organizational resilience into three phases, is modern and aligns with the various definitions of resilience that have been proposed in the literature. In the same manner, Hepfer and Lawrence (2022) examine organizational resilience and divide this research into three different sub-categories: functional resilience, operational resilience, and strategic resilience. Where Duchek examined organizational resilience as a blanket concept encompassing all types of adversity, Hepfer and Lawrence (2022) argue that the type of adversity occurring will determine which form of resilience is elicited.

Hepfer and Lawrence suggest that different types of adversity will cause different types of resilience to be needed. Functional resilience is needed when adversity interferes with a distinct organizational function, causing a single unit of an organization to be affected (Hepfer & Lawrence, 2022). For this, they give an example of a hospital in which a local tragedy causes an influx of patients in the emergency room, however, the rest of the hospital, radiology, inpatient services, and others, are unaffected. The adversity is thus localized in one unit of the hospital, the emergency room. Functional resilience describes the ability of this one function, unit, or system, to respond positively to the adversity (Hepfer & Lawrence, 2022). Functional resilience relies on a foundation of functional knowledge. This functional knowledge is specific to the functions nestled inside organizations and includes an understanding of vulnerabilities and risks that are function-specific (Hepfer & Lawrence, 2022). Ambulkar et al. (2015) note that the roots of functional knowledge stem from previously faced adversity which prepares organizations for future disruptive events of a similar nature. Along with this functional knowledge, Hepfer and Lawrence (2022) assert that the flexibility of a function's design and infrastructure are also key. Design and infrastructure can include material aspects, such as a computer network, as well as social aspects, such as the communication and relationships between members on the function's team. Flexibility and agility can be key to dealing with adversity on a functional level both amongst members of the team as well as in the material aspects used in the team (Hepfer & Lawrence, 2022).

The second form of organizational resilience Hepfer and Lawrence (2022) describe is operational resilience. Any adversity that affects the organization as a whole, potentially affecting the organization's ability to continue operating as a whole, falls under this category. For example, Covid-19 caused countries' to completely shut down museums, stopping them from

operating at all. Operational attentiveness is cited as being key to operational resilience (Hepfer & Lawrence, 2022). Being aware of any potential threats to operations is needed, and this can be achieved through external audits. Operational resilience can challenge overlearned routines and result in innovations and changes to operations in response to adversity (Weick, 1993; Hepfer & Lawrence, 2022). Notably, financial slack, organizational structure, prior work experience, and social relationships all play a role in successful organizational resilience.

Lastly, adversity that affects a business' long-term goals is referred to as strategic resilience (Hepfer & Lawrence, 2022). Strategic resilience describes a business' ability to anticipate and respond to threats to its strategies which can include its competitive advantage or long-term goals and objectives. For example, the invention of new technologies can disrupt current business strategies, such as the effect that Amazon had on Barnes and Noble's brick and mortar bookshops. Strategic resilience requires senior leaders to have strategic awareness and agility in decision-making (Buyl et al. 2019). Hepfner and Lawrence (2022) argue that strategic resilience can be achieved through strategic adaptations including leveraging a business' resources to respond to adversity creatively.

Hepfner and Lawrence (2022) recognize that one adversity might cause different businesses to react in different ways and trigger different resilient necessities. One business might be affected in one unit, while another may be affected as a whole, and another may be affected through its long-term goals. Ergo, one adversity could have one business needing functional resilience, one needing operational resilience and one needing strategic resilience. From their research, Hepfer and Lawrence (2022) outlined the key foundations, dynamics, and outcomes associated with each type of resilience, functional, operational, and strategic, as seen in Figure 4.

Figure 4: Foundations, dynamics and outcomes of organizational resilience (Hepfer & Lawrence, 2022, p. 18)

Foundations, Dynamics, and Outcomes of Organizational Resilience.		
	Foundations	Dynamics
Functional resilience	Functional knowledge: Understanding of function-specific vulnerabilities and risks Situated functional mindfulness Prior experience with disruptions in function Functional design and infrastructure: Functional infrastructure and architecture Intra-functional relationships Flexibility	Flexibility in responding: Restructuring and deployment of functional resources Efficient execution of functional routines Improvisation
Operational resilience	Operational awareness: Recognition of potential threat Shared situational awareness Attentional foci of organizational members Organizational resources: Tangible (financial slack, organizational structure) Intangible (relationships, experience)	Organizational understanding: Intra-organizational discussions and interpretations Organizational responses: Organizational coordination and communication Innovative behaviour in the face of adversity Managing intra- and inter-organizational relationships
Strategic resilience	Strategic attention: Perception of environmental threats and opportunities Attitude towards strategic risks Ability to recognize need for change Endowments: Resources Business model	Top management exploration/understanding: Discussions within strategic decision-making team Interpretation of strategic threats Strategic adaptation: Positive adaptation to strategic threats Innovation and exploration of business model
		Outcomes Efficiency: Functional cost efficiency Functional reliability and stability Time to recover Short-/medium-term performance: Recovery in terms of ROA, cash flows, volatility, sales growth Long-term performance: Organizational longevity Profitability and market value Survival

From this examination, Hepfer and Lawrence (2022, p. 17) propose a recursive model of resilience that “connects the foundations, dynamics and outcomes of organizational resilience through processes of application, transformation and learning”. This model is shown in Figure 5.

Figure 5: A Cyclical Model of Organizational Resilience (Hepfer & Lawrence, 2022, p. 19).

Though Hepfer and Lawrence (2022) focused extensively on dividing organizational resilience into three different areas, functional, operational, and strategic, their model ignores this segmentation and focuses on the intricacies of each individual business' behaviors when faced with adversity.

2.5.1. Conclusion

Knowing that adversity could occur, businesses are expected to have a certain level of preparation for adversities. In the literature on organizational resilience, adversity is seen as a necessity for resilience to occur. Depending on how this adversity affects an organization, organizational resilience can be broken down into the subcategories of functional resilience, operational resilience, and strategic resilience. In each of these subcategories, the affected businesses can cope with the goal of mere survival, or cope with the intent to adapt and innovate in order to achieve a new state. This combination of Duchek's (2019) framework for organizational resilience applied to Hepfner and Lawrence's (2022) identification of organizational resilience subcategories paints a clearer picture of organization resilience. As mentioned previously, tourism businesses adhere to the concepts presented in organizational resilience literature. Thus, this combinational framework could be applied to tourism businesses specifically. Within this framework, it is important to understand how organizational resilience can be measured and what factors influence organizational resilience in order to apply the framework properly.

2.6. Factors of Resilience

In 2017, Linnenluecke found that there was not yet research which had developed a robust or universally accepted measurement of organizational resilience. As shown in the understanding resilience section, there is a vast array of definitions of resilience. Being defined in many different ways makes resilience difficult to measure universally. In fact, most measures of organizational resilience are case-based (Saad et al., 2021). Moreover, when adopting an organizational resilience measurement strategy, researchers must be aware of possibly distorting

data if the measurement is based on large organizations in the developed world and is then applied to small to medium businesses (Saad et al., 2021).

Business resilience has been assessed with measurements developed in various fields of study. For example, researchers studying firm level resilience have measured this resilience at the level of the individual, usually measuring this from the psychological point of view (Linnenleucke, 2017). However, these different areas of study have also defined resilience in various ways, making the measurement of resilience less-transferable from discipline to discipline (Saad et al., 2021).

On top of the varying definitions of resilience, another issue when measuring resilience universally is the nature of the adversity being faced. The diverse nature of these adversities can lead to different businesses facing different challenges, and thus different means of measurement could be necessary. As discussed through Hepfer and Lawrence's (2022) study, one adversity could cause various businesses to require different types of business resilience. Due to these changing variables, "a widely adopted measurement instrument has not yet emerged" (Saad et al., 2021, p. 14).

From their analysis of 118 journal articles focusing on organizational resilience, Saad et al. (2021) determined that most studies regarding methods to study organizational resilience are theoretical case studies and not empirical studies. Theory building appears to be the leading research in this literature at this time, showing a gap in the literature and a need for an empirical study of organizational resilience. Furthermore, Saad et al. (2021, p. 14) determined that there were no studies "applying the method of a literature review to structure the divergent views of the concept in the area of SME resilience". Saad et al. (2021, p. 14) recommends more empirical studies to be conducted in this area as there appears to be little knowledge of strategies and

methods of resilience for businesses empirically researched, or researched "on the ground".

There is an obvious gap in the literature for an empirical study focusing on strategies and methods of business resilience.

2.6.1. Factors of Business Resilience

Many different factors may influence business resilience, however, there is no agreed upon set of resilience indicators in the literature (Saad et al., 2021). In contrast to the argument made by Saad et al. (2021) when they mentioned the possibility of distorting data when using the same measurement system to measure large businesses resilience versus small and medium sized businesses, Demmer et al. (2011) has suggested that factors influencing large business' resilience may also be applied to small and medium sized businesses. So, though the measurement of resilience may be affected when considering the size of an organization, factors of resilience appear to be cross-functional. Saad et al. (2021) dissected the factors of business resilience mentioned in the 118 analyzed articles, clustering these factors into four key clusters: entrepreneurial characteristics, firm characteristics, business environments, and interaction/interplay effects.

2.6.1.1. Entrepreneurial Factors

Entrepreneurial factors include the business' owner's background, such as age, gender, and lifestyle, as this can affect a company's resilience level (Biggs et al., 2012). In the case of gender, Saad et al. (2021) note that the literature shows a rise in women-owned businesses despite the disruptions being faced. There is, however, little research empirically investigating gender differences in regard to business resilience (Saad et al., 2021).

Human capital is also included in entrepreneurial factors. Management practices as well as employee participation can affect business resilience. Biggs et al. (2015) argues that a critical

contribution to business resilience are human resources such as requisite skills and experience levels. Biggs et al. (2015) found a positive relationship between business owners' human capital and business resilience. However, Saad et al. (2021, p. 17) notes that "evidence about the effect of an entrepreneur's HC on business success is not conclusive yet".

Entrepreneurial behaviors, practices, strategies, decision-making styles, and actions taken by entrepreneurs are referred to as entrepreneurial orientation by Saad et al. (2021).

Entrepreneurial orientation is another entrepreneurial factor affecting business resilience. The level of risk-taking, innovation, and proactivity can all play an important role in business resilience and is considered a part of entrepreneurial orientation (Saad et al., 2021).

Lastly, Social capital is another dimension of entrepreneurial factors affecting business resilience. This refers to how well and to what extent businesses utilize networks, such as relationships with other entrepreneurs, businesses, groups, or institutions, to enhance their resilience in the face of adversities (Saad et al., 2021). Biggs et al. (2015) recognized the importance of the buffer that social networks can provide to businesses in the face of adversity. Strong social networks can allow for the transfer of knowledge as well as collaboration on innovative activities. Government organizations can also enhance a businesses resilience through an expanse of resources and is considered to be part of this social capital dimension (Saad et al., 2021).

2.6.1.2. Firm characteristics

A firm's internal factors are included in entrepreneurial factors affecting resilience. Internal factors can include physical and financial capital. Access to finance is incredibly important for business resilience (Saad et al., 2021). Lack of this access to finance or lack of available credit for businesses can be a hindrance on business resilience. Research suggests that

"the financial position of an SME in the run-up to an economic downturn is more important than age or size of the company in determining the impact of the crisis on the company" (Saad et al., 2021, p. 18). Vulnerable businesses, when facing adversity, are more likely to rely on credit to keep their business going. However, Saad et al. (2021) notes that access to credit can be affected by collateral-related problems.

Along with access to finance, research suggests that rapid decision making skills can also enhance business resilience. Sullivan-Taylor and Branicki (2011) found that small businesses often have less bureaucracy than larger organizations and are therefore able to make quicker decisions as well as have quicker communication capabilities allowing for increased resilience. This agility in the decision-making process can lead to faster business transformation and adaptation, leading to business resilience.

2.6.1.3. Business Environments

Factors affecting a business environment include, cultural, socio-economic, and political conditions. Favorable business environments can lead to company growth while unfavorable conditions can cause disruptions. Infrastructural related hurdles, restrictive regulatory systems, limited access to markets, institutional voids, limited access to technologies can impede business resilience and stifle growth (Saad et al., 2021).

2.6.1.4. Interaction/ Interplay Effects

Though there has been research conducted examining the previously mentioned factors affects on business resilience, there has been few studies examining how these factors' interactions might play a role in business resilience (Saad et al., 2021). Though it is noted that all the aforementioned factors play a role in business resilience, the combination of these factors and

the relationship, or lack thereof, between these factors require further examination. Dahles and Susilowati (2015) argue that the lack of research in this area leads to a disheveled understanding of factors influencing business resilience.

2.6.2. Factors of Tourism Business Resilience

Doğantan and Akoğlan Kozak (2019, p.137) determined from their study that “in terms of tourism enterprises which continue their activities in a turbulent environment, it is seen that it is more important to create a [resilience] capacity that is far beyond the post-crisis recovery strategies, which increases the resilience to vulnerabilities”. Also of interest, Doğantan and Akoğlan Kozak (2019) examined factors of business resilience in relation to tourism business. Doğantan and Kozak (2019, p. 136) defines “planning strategies, proactive posture, access to information, networks and relations, leadership, and business culture as the dimensions of resilience capacity in tourism businesses”. This appears to align with the previously discussed factors of business resilience argued by Saad et al. (2021). Both Orchiston et al. (2016) and Doğantan and Kozak (2019) found that planning and culture, and collaboration and innovation are the key factors for tourism business resilience.

Doğantan and Kozak (2019) also concluded that access to information is a key factor to tourism business resilience as well. Notably, they did not find a difference between different types of tourism businesses when it came to the following factors: planning strategies, networks and relations, proactive posture, information access, and business culture dimensions. However, they did determine that the leadership factor was much stronger in travel agencies than in accommodation businesses.

In all tourism businesses, they determined that dynamics that are closely related to the creation of flexibility, adaptability and agility are important to resilience. Such dynamics include business culture which can be a great determinate of creativity and collaboration elements within a business. However, the information presented particularly identifying tourism business resilience factors did not stray from ideas presented in literature outlining business resilience factors.

2.6.3. Conclusion

There is not a universally accepted method for measuring business resilience. However, business resilience factors have been identified. These factors appear to directly translate to tourism businesses, as the same factors can be seen to be discussed in both. Entrepreneurial factors, which take into consideration individuals/ employees in an organization, are key when examining business resilience. Firm characteristics and business environments are also key factors that must be acknowledged when discussing business resilience. Lastly, the ways in which these factors interact with one another would be an important understanding, though there has yet to be research which examines these relationships. All of these same factors can be seen in tourism businesses when examining tourism business resilience.

2.7 The Theory of Resilience Categorization

Throughout the literature, from definitions in various disciplines to frameworks of resilience, common themes occur. From these common themes, a theory of resilience categorization takes shape. The core principles in each definition of resilience across various disciplines remain the same. These definitions can then be divided into two categories-- backward-thinking and forward-thinking. This means of categorization was introduced in 2021

by researchers Weking, Pérez, & Schaffer, though it has not been widely explored. They explain that backwards-thinking resilience models and definitions focus on returning to a pre-existing state of equilibrium (Weking, Pérez, & Schaffer, 2021). On the other hand, forwards-thinking resilience models and definitions focus on turning challenges into opportunities for growth and innovation, thereby creating a superior performance than was previously being experienced (Weking, Pérez, & Schaffer, 2021).

In the aforementioned definitions and frameworks of resilience, regardless of whether the definitions are categorized as forward or backward-thinking, the definitions all necessitate the need for adversity or a stressor. As shown previously, the need for adversity or an instigating event is found in most definitions of resilience and is a core principle necessity for resilience to occur. Simply put, there has to be a reason for resilience to take place.

Other themes in the definitions and frameworks appear as well, such as preparedness for possible triggering events. There are various studies on resilience which “suggest that resilience implies pre-event readiness for a disruptive event, post-event response for appropriate and timely recovery, and creative renewal capacity through improvisation” (Kantur & İşeri-Say, 2012, p. 764). The concept of preparation can be examined in both forwards and backwards-thinking resilience methods.

Similarly, many definitions and frameworks, both backwards and forwards thinking, include the need to recover. As previously mentioned, backwards thinking definitions discuss this recovery as being a bouncing back or achieving previously achieved success or normality while forwards thinking definitions focus on exploiting the stressor and achieving more than previously achieved or simply achieving this in a new adaptive way. Both forwards and

backwards thinking resilience still must recover, even if the recovery is focused on different goals.

The following figure, figure 1, displays the similarities and differences in forward versus backwards thinking definitions by showing where the two definitions diverge from one another:

Figure 1:

Though this means of categorization was introduced in 2021, it has not been widely researched. There is little information on the motivation behind forward thinking and backwards thinking resilience methods. This shows a gap in the literature and a need for further research in this area. Though there is little research in this area, when examining various definitions of resilience it is easy to sort them into the backwards-thinking or forwards-thinking category.

2.7.1. Backwards-thinking Resilience

In backwards-thinking resilience definitions, emphasis is placed on bouncing-back or returning to a certain pre-existing state. This can even be examined in the Latin word from which resilience derives, *resilio*, which means to jump back (Klein, Nicholls, & Thomalla, 2003).

This idea of bouncing back is typically seen in academic subjects such as engineering. As mentioned previously, Folke (2006) defines engineering resilience as the ability to bounce back to the predesigned stage or function after facing stress. Walker (2020, p. 1) poses a simple definition of resilience, stating that resilience is “the ability to cope with shocks and to keep functioning in much the same kind of way”. This definition can be applied to business, society as a whole, or even an ecosystem in the context of examining how much stress these subjects can handle while functioning in the same way as before the stressor was enacted. Folke (2016, p. 43) argues that many researchers interpret resilience as bouncing-back from a disturbance to an original state.

2.7.2. Forwards-thinking Resilience

In contrast, Weick et al. (1999) suggests that resilience is not only about continuing to function in a changing environment, but also about adapting to and exploiting the change. Folke et al. (2020, p. 43) proceeds to define resilience as “having the capacity to persist in the face of change”. Walker (2020, p. 1) reiterates this analysis, stating that a common misconception about resilience is that it refers to something’s ability to ‘bounce back’ when in fact resilience actually refers to change, reorganize, and adapt to a disturbance, not simply to recover or ‘bounce back’.

Lengnick-Hall and Beck (2003) maintain this sentiment, defining resilience as more than bouncing-back. They align with Weking, Pérez and Schaffer’s (2021) argument that resilience is

about turning challenges into opportunities for growth and innovation, with the intent of creating a superior performance than was previously being experienced rather than returning to the previously held state. These definitions highlight the need for adaptation to be maintained in the long-run leading to increased competitive advantage. Adaptation and innovation tend to be key areas of focus in forward-thinking resilience definitions.

As seen throughout this discussion, innovation is often discussed as a necessity for forward-thinking resilience. However, Euchner (2019) flips this argument, stating that resilience is essential for innovation. This argument stems from the idea that innovation can be disruptive, necessitating the need for resilience. On the contrary, Do et al. (2022) states that resilience allows for and is aided by innovation. Regardless, both Do et al. (2022) and Euchner (2019) agree that forward-thinking resilience and innovation are intertwined, differentiating forwards and backwards-thinking resilience.

2.7.2.1. Forwards-thinking Business Resilience and Innovation

Previously mentioned, Nauck et al. (2021) determined that organizational resilience requires business model innovations. “The aim of business model innovation, as a strategic measure, is to ensure company survival in times of environmental change and turbulence” (Buliga, Scheiner, & Voigt, 2015, p. 650). Organizations may use business model innovations to respond to external shocks and as a tool to build organizational resilience (Weking, Pérez, & Schaffer, 2021).

Weking, Pérez, and Schaffer (2021) aggregate business models using four distinct characteristics: market segments, value chain, value proposition, and value capture mechanisms. In order to be classified as an innovation, Buliga, Scheiner, and Voigt (2015) argue that the new

business model must either attract new customer groups or fulfill unmet needs of current customers. Examples of innovations in business models for value creation and capture include “open business models, customer-focused business models e.g., targeting the base of the economic pyramid, “market maker” business models, which create entirely new stages within the value chain, or business models based on product-service systems in the manufacturing industry” (Buliga, Scheiner, & Voigt, 2015, p. 650). Buliga, Scheiner, and Voigt (2015) conclude that business model innovations are a prerequisite for organizational resilience.

Zhang, Long, and von Schaewen (2021) argue that technological innovation is an effective method for achieving organizational resilience. “The rapid development of digital technologies, such as artificial intelligence, big data, cloud computing, blockchain, and the industrial internet, is transforming the traditional economy into the digital economy and intelligent economy, and digital transformation has become an integral mechanism for enterprises to achieve breakthrough innovation and sustainable development” (Zhang, Long, & von Schaewen, 2021, p. 1).

Though Zhang, Long, and von Schaewen (2021) assert that technological innovation aids organizational resilience, they also acknowledge that such innovations have the ability to disrupt existing processes and structures as also noted by Euchner (2019) previously. This displays inherent risks associated with innovations, as innovations can fail or cause unforeseen issues that disrupt the organization more. However, forward-thinking business resilience insists that innovation is key, despite associated risks.

Dias et al. (2022) notes that ease of access to finance is the biggest positive contribution to organizational innovations. Access to finance can take various forms, such as equity funding,

grant funding, and debt funding. When scarce, access to finance is a hindrance to organizational innovation and remains a major obstacle for organizations (Dias, et al., 2022). Despite this challenge, forward-thinking resilience argues the need for large and small organizations to find ways to innovate and adapt in order to remain resilient during times of change.

Innovation is not recognized as a necessity when considering backwards-thinking resilience as backwards-thinking resilience is focused on mere survival. The goals of the organization are key for determining the type of resilience to analyze, forward or backwards-thinking. Once the goals are chosen and resilience is defined within that scope, a resilience framework can be examined. Business resilience and business resilience frameworks can then be applied to specific industries.

2.7.3. Forwards and Backwards-thinking Resilience in Business Literature

When re-examining business resilience definitions in the lens of this categorization method, whether the definition is forwards or backwards-thinking can be easily deciphered. For example, Murison’s (2021, p. 1) definition, “a resilient organization is not one that is simply able to return to where it left off before the crisis. A truly resilient organization is one that has transformed, having built the attitudes, beliefs, agility and structures into its DNA that enable it to not just recover to where it was, but leap-frog forward quickly”, can be categorized as forwards-thinking resilience as Murison focuses on adaptation and transformations stemming from adversity. Murison specifically argues against backwards-thinking resilience, arguing that returning to where an organization or business left off is not enough (Murison, 2021).

Santoro, Messeni-Petruzzelli, and Del Giudice (2020) even go as far as arguing that organizational resilience can be seen from two differing perspectives, specifically addressing the

categorization of resilience without specifically stating this categorization. As mentioned previously, one side argues that organizational resilience stems from the ability to rebound from adverse situations, while the other side states that organizational resilience is shown through the creation of novel opportunities from the development of new capabilities, or innovations. The former appears to adhere to the ‘bounce-back’ theory of resilience whereas the latter takes into consideration the need for adaptation and innovation for resilience to occur, mimicking the forward-thinking resilience notions.

Hepfer and Lawrence (2022, p.8) can be seen to account for both forward and backwards resilience thinking as they describe both a recovery as well as an adaptive quality in the following definition: business resilience is “the ability of an organization to anticipate, respond to, recover from, and learn from adversity”. However, this will differ from organization to organization, as being forwards or backwards thinking in terms of resilience is reliant on the organizations personal goals, motivations, and strategies.

Whether the organization’s aim is to bounce back/ return to its previous state or to adapt and innovate to achieve a new state determines if the organization falls into the backwards or forwards-thinking resilience category. The definition of business resilience will change depending on if the business is adhering to forwards-thinking resilience or backwards-thinking resilience goals.

When innovation is considered essential and the goals are in line with achieving a new state, business resilience is examined from a forwards-thinking perspective. As mentioned previously and as seen throughout the discussion on business resilience, when forward-thinking resilience is examined, innovation is often seen as a key factor.

As with organizational resilience, tourism business resilience can also be examined from a backwards-thinking and forwards-thinking resilience perspective. As previously mentioned, Buultjens et al. (2017, p. 84) defined tourism industry resilience as “the capacity of the industry to deal effectively with disasters and self-inflicted crises in order to maintain ... stability ... whilst also ensuring the flexibility and diversity necessary for innovation and further development”. Although this definition is at an industry level, it appears to have elements of both backwards and forwards thinking resilience as it notes a maintenance of stability as well as allotment for innovation and development. Tourism organizational resilience appears to have the same requirement of innovation mentioned in organizational resilience literature when examining these types of businesses from a forward-thinking resilience mindset.

2.7.3.1. Forwards and Backwards-thinking Resilience in Business Resilience Frameworks

Business resilience frameworks can also be easily categorized as either forwards or backwards-thinking. As mentioned previously, both forwards and backwards-thinking resilience have an element of preparation and therefore anticipation. However, forwards-thinking resilience entails a different end result, one that requires adaptation and innovation, whereas backwards-thinking resilience would merely cope and survive through adversity. This phase, the adaptation phase, appears to be what separates forwards and backwards-thinking businesses.

Therefore, I argue that Ducheck’s framework requires separation in order to account for forwards and backwards-thinking approaches. Though both forwards and backwards-thinking businesses go through the preparation or anticipation phase, and both attempt to survive and cope through adversity, only forwards-thinking businesses attempt to change and adapt. However, learning could occur in both forwards and backwards-thinking businesses.

Forwards-thinking businesses would take this knowledge and adapt, whereas backwards-thinking businesses may not implement any changes but may still add to their knowledge base. Though, this is not to say that forwards-thinking businesses are more likely to succeed. Duchek notes that organizations must also be aware that putting new knowledge into practice can create new problems or necessitate further changes” (Duchek, 2019, p. 232). Moreover, Duchek (2019) states that studies show that two out of three of businesses’ change initiatives fail.

Hepfner and Lawrence’s (2022) model also fails to directly acknowledge a distinction between backwards and forwards-thinking resilience; however, this can be interpreted when examining each individual business’ responses and behaviors when faced with adversity. It is important to note that organizational resilience literature fails to include a framework that explicitly recognises forwards and backwards resilience thinking. This shows a gap in the literature.

2.7.5. Conclusion

Resilience definitions all focus on the element of recovery, though forwards and backwards resilience thinking differ in their end states. While forward thinking resilience relies on adaptation and innovation to lead to a new state, backwards-thinking resilience definitions focus on a return to the original state. While the two have different outcomes, both necessitate adversity or a stressor to occur and many definitions note a need for preparedness. With the broad understanding of resilience and the understanding of the two areas of classification, as displayed in figure 1, we can then dissect resilience as it pertains to specific industries and on an individual business level.

Business resilience or organizational resilience has been discussed from both forwards and backwards-thinking resilience perspectives, though not directly. In business resilience, strategies for survival as well as strategies for innovation and adaptation are argued, taking on backwards and forwards-thinking resilience perspectives. Employee level resilience is also examined when taking into consideration organizational resilience as a whole. Employee resilience can be seen as useful when tackling innovations and adaptations in the face of adversity. Though researchers in this literature have argued increasingly for the necessity of innovation, it does not mean that forward-thinking resilience is the only type of resilience needed. In fact, forward-thinking resilience comes with its own risks, as innovations can cause its own disruptions.

Backwards and forwards-thinking resilience perspectives are both equally valuable to be examined in terms of business resilience. This concept of business resilience can also be applied to specific industries, such as tourism businesses. Business resilience definitions and frameworks have been shown to be utilized when examining tourism business resilience. However, these definitions and frameworks do not directly take into consideration the different categories of resilience. Hepfner and Lawrence’s resilience segmentation combined with Duchek’s resilience model when taking into consideration both backwards and forwards resilience would provide a better understanding of business resilience.

2.8. Discussion

Tourism is an industry that is highly susceptible to adversity, increasing the importance of understanding resilience as it relates to tourism. Though, resilience tends to be defined in various manners. However, resilience definitions necessitate the need for preparation for adversities as well as the need for an adversity to occur. Backwards-thinking resilience encourages the return to

a previous state, whereas forwards-thinking resilience actively aims to achieve a new state following adversity.

In tourism literature, tourism business resilience is seen as key to overall tourism resilience. This stresses an importance in understanding tourism business resilience. In the literature, concepts from business resilience are applied directly to tourism businesses. Business resilience has been indirectly discussed from both forwards and backwards-thinking resilience perspectives. Survival as well as innovation and adaptation are discussed as elements of business resilience and are applied to tourism business resilience as well. Within this discussion, employee level resilience is acknowledged as influential to business resilience.

Backwards-thinking and forwards-thinking resilience perspectives can be seen throughout the literature on business and tourism business resilience. Though forward-thinking resilience tends to be heavily discussed within this literature, arguing a need for innovation and adaptation, it is also acknowledged that forward-thinking resilience comes with its own risks, as innovations can cause its own disruptions. Thus, it can be assumed that both backwards and forwards-thinking resilience perspectives are both equally valuable to be examined in business resilience and tourism business resilience.

Tourism business resilience literature and business resilience literature share many similarities. Business resilience definitions, strategies, and frameworks have been applied specifically to tourism businesses. As tourism businesses are noted to be highly susceptible to adversities, business resilience is highly valued. Tourism business resilience can also be examined from both backwards and forwards-thinking resilience perspectives and business resilience frameworks can be applied directly to tourism businesses.

A combination of Duchek's (2019) framework for organizational resilience applied to Hepfner and Lawrence's (2022) identification of organizational resilience subcategories paints a clear picture of organizational resilience. Preparation for adversities and the occurrence of an adversity is acknowledged in this business resilience framework. As adversities can affect different businesses in different ways, resilience can then be broken down into the subcategories of functional resilience, operational resilience, and strategic resilience. Within these subcategories, affected businesses can then cope with the adversity with the goal of returning to a previous state, or cope with the adversity with the intent to innovate and adapt in order to achieve a new state.

As there is not a universally accepted method for measuring business resilience, understanding the factors that contribute to business resilience is necessary. These factors for business resilience can and have been applied to tourism businesses. Individuals/ employees are taken into consideration when examining entrepreneurial factors of business resilience. Also acknowledged as factors of business resilience are firm characteristics and business environments. Though the ways in which these factors interact with one another has yet to be examined, this has also been identified as a possible factor for business resilience. These factors, frameworks, and definitions of business resilience are reiterated throughout tourism business resilience literature. However, there remain several gaps in the literature.

Notably, forwards and backwards-thinking resilience has not been widely researched or applied to tourism business resilience. Furthermore, the combination of Duchek's (2019) framework and Hepfner and Lawrence's (2022) resilience segmentation has yet to be examined in a tourism context. Lastly, though resilience is an important concept in tourism, there has yet to

be a specific definition of tourism business resilience presented. This shows the need for further research in this area and this need has been reiterated throughout existing literature.
